

Increased risk of hospitalisation from Covid–19 with increased age and gender type

Percentage of patients hospitalised based on age and gender

The arrow indicates risk is greater for those over the age of 50.
The colour blocks break the graph into age categories: 0–17, 18–49 and 50+ and show the average percentage of patients hospitalised in that age category.
Dashed line at 50% to indicate the ages (data points above this line) where over half of confirmed covid patients were hospitalised.
